WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. Troops in transit and certain small detachments are not required to submit reports; for this and other reasons, total strength of reporting units has been consistently about 1 percent below the actual strength of the Army in this country. The mean strength shown for individual stations is that of Army personnel attached or assigned for medical care and does not include organizations not on the post but dependent on the station for hospitalization.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

Admissions are reported only for cases admitted to a medical installation (either to hospital or quarters) and not returned to duty within the same day, except for certain cases carded for record only (chiefly venereal disease cases treated on a duty status, and deaths which occurred before admission to hospital or quarters). Admissions designated as "injury" comprise all "new" traumatisms (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, as well as various types of wounds not due to enemy action) other than battle casualties. Under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties. All cases other than those of injury or battle casualty are classified as "disease."

Admission rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. It may be noted that under the term infectious hepatitis are included cases reported as jaundice and cholangitis. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The average proportion of the daily strength of the command which is confined to hospital or quarters (mean number of non-effectives per thousand strength) is given in the summary table for the total United States and for each of the Service Commands. More significant is the estimated non-effective rate for personnel stationed in the United States shown in the chart on page 7.

The number of enlisted men discharged during the week on Certificates of Disability for Discharge (CDD) are shown for individual stations. These data should be distinguished from the figures for "honorable discharges for physical and mental disqualification" assembled by The Adjutant General's Office; the latter include discharges for inaptness in addition to CDD's and are tabulated on a somewhat different basis (e.g., the April data represent April discharges processed by the AGO during April and May plus discharges prior to April which were processed in May).

In making comparisons between Service Commands it should be borne in mind that morbidity rates naturally tend to be higher in those Service Commands which have a relatively large number of General Hospitals and Ports of Embarkation. The presence of sizeable numbers of troops not under the jurisdiction of a Service Command (e.g. casualties, task force troops, etc.) affects the interpretation of the data from the viewpoint of Command responsibility.

MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 15 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table. It should also be noted that reception, redistribution, and separation centers frequently report relatively large numbers of admissions arising from routine physical examinations of large bodies of troops.

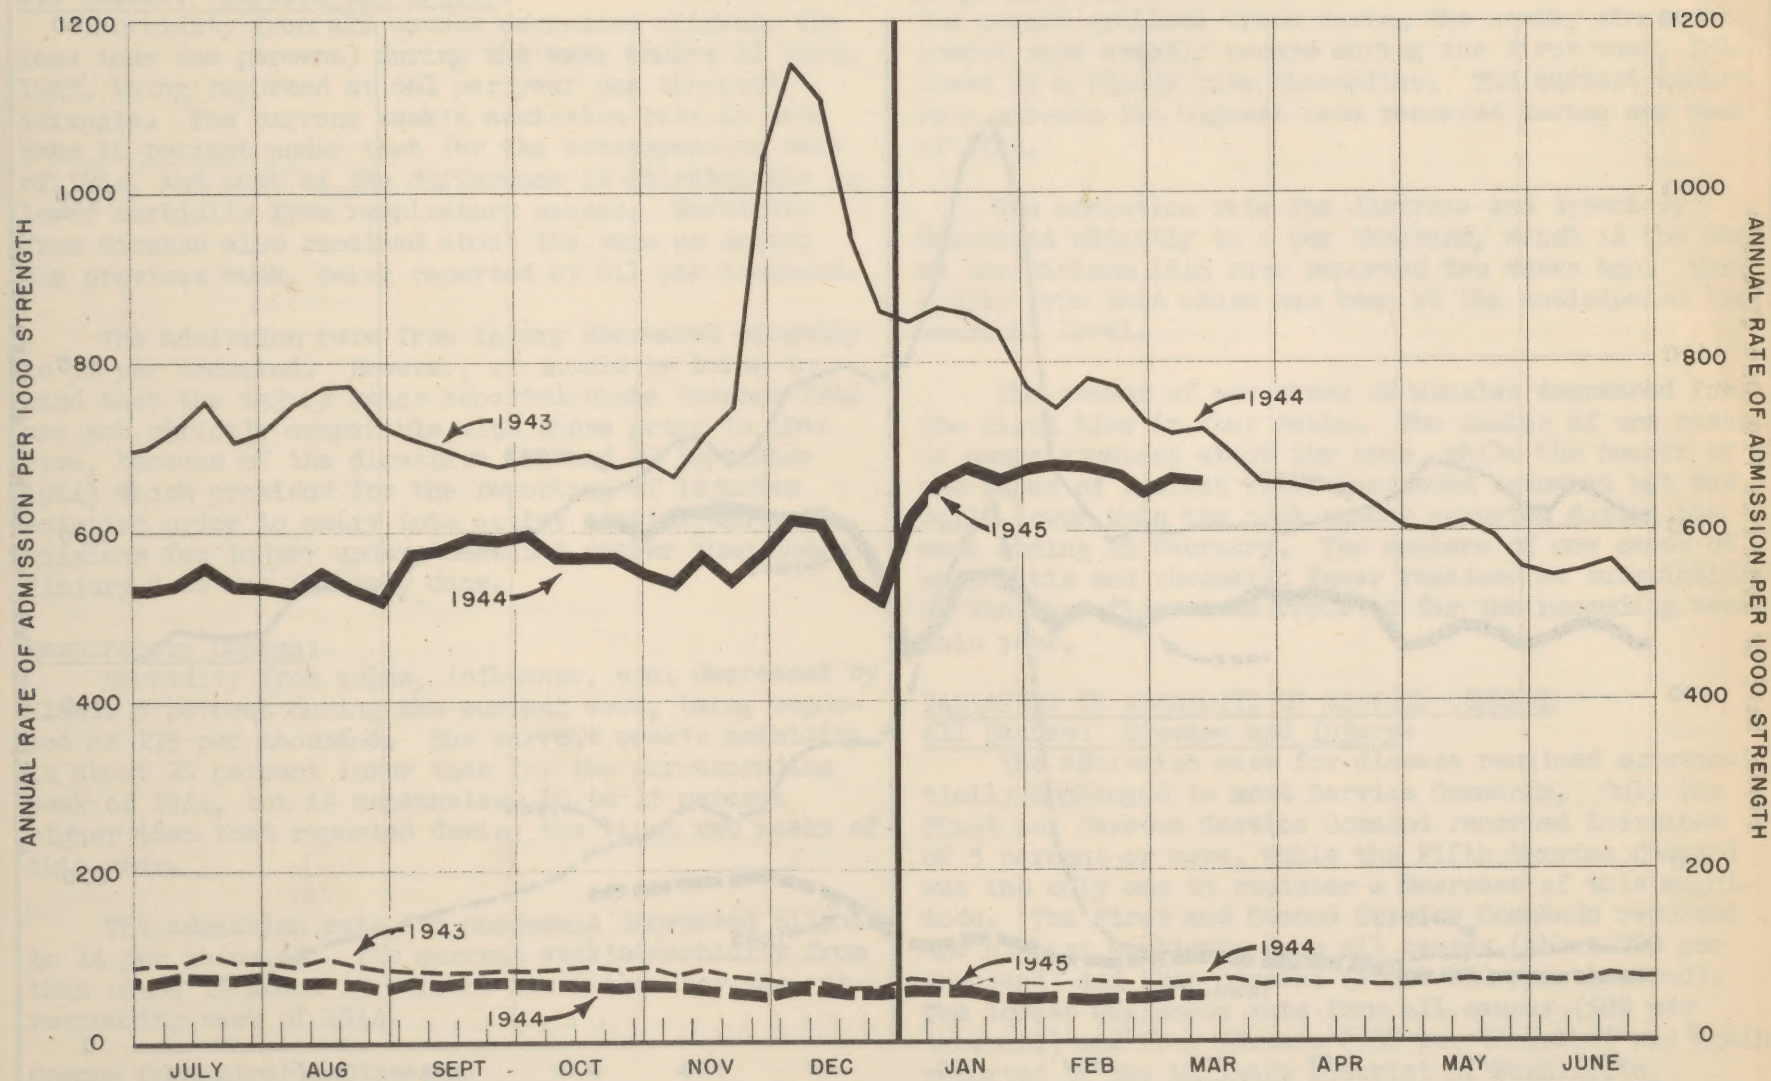

EXPLANATORY MATTER

In reading the detail tables, it should be born in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where the current week's data for a particular station have not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

MORBIDITY FROM DISEASE ONLY COLDS, INFLUENZA, ETC.

CONTINENTAL UNITED STATES

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATESAll Causes: Disease and Injury:

Morbidity from all causes decreased slightly (by less than one percent) during the week ending 16 March 1945, being reported at 661 per year per thousand strength. The current week's admission rate is less than 10 percent under that for the corresponding week of 1944, and most of the difference is attributable to lower morbidity from respiratory causes. Morbidity from disease also remained about the same as during the previous week, being reported at 611 per thousand.

The admission rate from injury decreased slightly to 50 per thousand. However, it should be borne in mind that the injury rates reported since October 1944 are not strictly comparable with those prior to that time, because of the directive (issued 29 September 1944) which provided for the reporting of injuries existing prior to entry into active service and readmissions for injury under "disease" rather than under "injury," as was formerly done.

Respiratory Causes:

Morbidity from colds, influenza, etc. decreased by almost 5 percent during the current week, being reported at 175 per thousand. The current week's morbidity is about 20 percent lower than for the corresponding week of 1944, but is nonetheless 10 to 15 percent higher than that reported during the first two weeks of this year.

The admission rate for pneumonia decreased slightly to 14 per thousand. The current week's morbidity from this cause is about 15 percent lower than for the corresponding week of 1944.

Common Communicable Diseases:

Morbidity from venereal diseases, excluding cases

contracted prior to entry on active service, increased slightly to 44 per thousand. This increase reflects the normal cyclical trend during the month, since the lowest rate usually occurs during the first week, followed by a steady rise thereafter. The current week's rate exceeds the highest rate recorded during any week of 1944.

The admission rate for diarrhea and dysentery decreased slightly to 6 per thousand, which is the same as the minimum 1945 rate reported two weeks ago. Morbidity from this cause has been at the anticipated low seasonal level.

The number of new cases of measles decreased for the first time in four weeks. The number of new cases of mumps remained about the same, while the number of new cases of scarlet fever increased somewhat but was still lower than the peak number reported during the week ending 16 February. The numbers of new cases of meningitis and rheumatic fever remained at substantially the same figures as reported for the preceding weeks this year.

VARIATION IN MORBIDITY BY SERVICE COMMANDAll Causes: Disease and Injury:

The admission rate for disease remained substantially unchanged in most Service Commands. Only the First and Seventh Service Command reported increases of 5 percent or more, while the Fifth Service Command was the only one to register a decrease of this magnitude. The First and Second Service Commands reported the highest morbidity from all causes (about 730 per thousand) and from disease (about 690 per thousand). The lowest admission rate from all causes (580 per thousand) and from disease (538 per thousand) was again reported by the Military District of Washington, closely followed by the Fourth and Ninth Service Comds.

CONTINENTAL UNITED STATES

COMMENT ON CURRENT TRENDS (CONT'D)

The Fourth and Eighth Service Commands reported the highest morbidity from injury (57 per thousand), while the Second, Third, Sixth, and Seventh Service Commands all reported admission rates of less than 40 per thousand.

Respiratory Causes:

Morbidity from colds, influenza, etc. decreased in most of the Service Commands; the only Command reporting other than a minor increase in the admission rate was the Fourth (due to sizeable increase in admissions at Camp Blanding and Camp Gordon). Nonetheless, the Fourth Service Command continued to report the lowest morbidity from these causes (143 per thousand), closely followed by the First and Ninth Service Commands (about 150 per thousand).

The admission rate from pneumonia remained about the same in most Service Commands although the Sixth Service Command reported a significant decrease. The highest morbidity from this cause was reported by the Fifth Service Command (23 per thousand).

Common Communicable Diseases:

Morbidity from venereal diseases, excluding EPTS cases, increased in the majority of the Service Commands; the greatest rises were reported by the First and Sixth Service Commands. The highest morbidity from these causes was again reported by the Third Service Command (64 per thousand), with no other Service Command having a rate in excess of 51 per thousand. Only the Military District of Washington and the Ninth Service Command reported morbidity from these causes of less than 40 per thousand.

All Service Commands reported exceptionally low morbidity from diarrhea and dysentery, with no Command having a rate in excess of 7 per thousand. The number

of new cases of measles decreased sharply in the Fourth and Eighth Service Commands, although a large increase was reported by the Seventh Service Command (chiefly at Fort Snelling).

NON-EFFECTIVE RATE:

The non-effective rate for personnel stationed in the continental United States is estimated at 33.8 per thousand strength for the week ending 16 March as compared with approximately 36 per thousand for the corresponding week of 1944. The mean number of non-effectives in this country, including evacuees from overseas, rose to 84.4 per thousand.

PATIENTS REMAINING UNDER TREATMENT: 16 March 1945:

The number of neuropsychiatric cases remaining was 34,401 or about 1,000 more than at the end of the previous week. Non-battle injury patients remaining numbered 40,700. The number of battle casualty patients remaining increased by about 3,000 to number 63,748.

CERTIFICATES OF DISABILITY FOR DISCHARGE:

During the week ending 16 March there were 4,543 enlisted men discharged by CDD or about 200 more than the previous week. About 52 percent of these discharges were reported by General Hospitals. Included among the 4,543 CDD's were 2,029 neuropsychiatric cases.

CERTIFICATES OF DISABILITY FOR DISCHARGE

COMMENT ON RECENT DEVELOPMENTS

FOR THE FOUR WEEK PERIOD ENDING 23 FEBRUARY 1945

NATURE OF THE DATA:

The data of this Monthly Report, like those of the Weekly Health Reports, have been taken from Forms 86ab rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. However, unlike the Weekly Health Reports which are compiled on the basis of the figures as received, so as to place the information in circulation at the earliest possible time, the figures here presented for the four week period ending 23 February 1945 include the great majority of the corrected reports as well as reports received too late to be incorporated in the Weekly Health Report.

This Report covers morbidity and mortality data for all individual stations with a strength of 1000 or over and gives details for admissions from venereal diseases and for neuropsychiatric cases.

Charts showing morbidity trends from all causes, from all diseases combined, from injury, and from colds, influenza, etc. are presented on page 25. Similar charts for specified diseases appear on pages 27, 29, and 31. A chart showing mortality trends is presented on page 33. A summary for the month of the number of admissions and corresponding morbidity rates and of the number of deaths and corresponding mortality rates for the United States as a whole and for the Service Commands is given on page 34. The most pertinent morbidity data for individual stations are presented on pages 35 to 58. On pages 59 and 60 the seven stations with the highest rates of admission during the month are shown for each of the morbidity categories considered.

In reading the detailed tables, it should be

borne in mind that morbidity (or mortality) rates based on small numbers of cases are not reliable. For this reason the symbol "?" has been placed after rates computed on the basis of 5 or fewer cases. Attention is directed to the definitions of admissions and admission rates and the discussion of the proportion of total Army strength included in the stations covered by this Report as given on page 2. The term "month" in this report is used to denote the four or five week period based on the number of Fridays in the calendar month.

MORBIDITY FROM ALL CAUSES: DISEASE AND INJURY:

The admission rates from all causes and from disease for the Army in the continental United States increased slightly in February (by about 3 percent). The Navy shore stations in this country reported a somewhat greater increase in morbidity in February as compared with January (about 10 percent). The Army's morbidity from disease during February (626 per year per thousand strength) was the highest reported since March 1944, but was nevertheless about 10 percent lower than the rate for February 1944. All of the higher morbidity during February 1944 as compared with February 1945 arose from higher admission rates for respiratory causes.

The admission rate from injury decreased in February by 10 percent to 50 per thousand, which is by far the lowest rate on record. However, the recent experience is not strictly comparable with that prior to October 1944 because the relatively low level of injuries since that time reflects in part at least compliance with the directive issued 29 September 1944 which required readmitted and EPTS injuries to be reported as "disease" and not as "injury."

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

Higher morbidity from disease during February as compared with January was reported by every Service Command except the Third and Sixth; the former registered only a small decrease, while the latter reported a drop of almost 10 percent. Increases in morbidity in excess of 10 percent were reported only by the Second and Eighth Service Commands.

The Third Service Command reported the highest morbidity rates from all causes and from disease in February (both being about 15 percent higher than for the country as a whole), closely followed by the First and Second Service Commands. The lowest admission rates from all causes and from disease were again registered in the Seventh Service Command (both about 10 percent lower than for the country as a whole). It may thus be noted that there was relatively little spread between the Service Commands having the lowest and highest rates, whereas in previous winter seasons the range was usually wide.

The admission rate from injury decreased in every Service Command, with the greatest declines being reported by the Fourth, Fifth, Seventh, and Eighth Service Commands. The highest morbidity from injury during February was reported by the Fourth Service Command (56 per thousand), while the lowest was registered in the Sixth Service Command (36 per thousand).

RESPIRATORY DISEASES:

During February the admission rate from colds, influenza, etc. rose by 15 percent to 192 per thousand, which is the highest rate reported since March 1944, although about 30 percent below the corresponding rate for February 1944. Morbidity from respiratory diseases

also increased by about 15 percent in February at the shore stations of the Navy in this country, which reported a rate in excess of 250 per thousand.

Morbidity from colds, influenza, etc. increased in all Service Commands except the Sixth where a decrease of about 15 percent was reported. Increases of 20 percent or more were reported by the First, Second, Third, and Seventh Service Commands. The Fifth Service Command reported the highest morbidity from these causes (242 per thousand), followed by the Eighth Service Command and the Military District of Washington (both in excess of 220 per thousand). The lowest rates occurred in the Seventh and Ninth Service Commands (both about 160 per thousand).

Morbidity from all forms of pneumonia combined increased by about 15 percent in February. Nevertheless the admission rate for February 1945 was about 25 percent lower than during February 1944. Morbidity from pneumonia was higher in February in the majority of the Service Commands. The greatest increases were reported by the Third and Fifth Service Commands. The Sixth Service Command again experienced the highest admission rate from this cause (20 per thousand), closely followed by the Third, Fourth, Fifth, and Eighth Service Commands (17 to 18 per thousand).

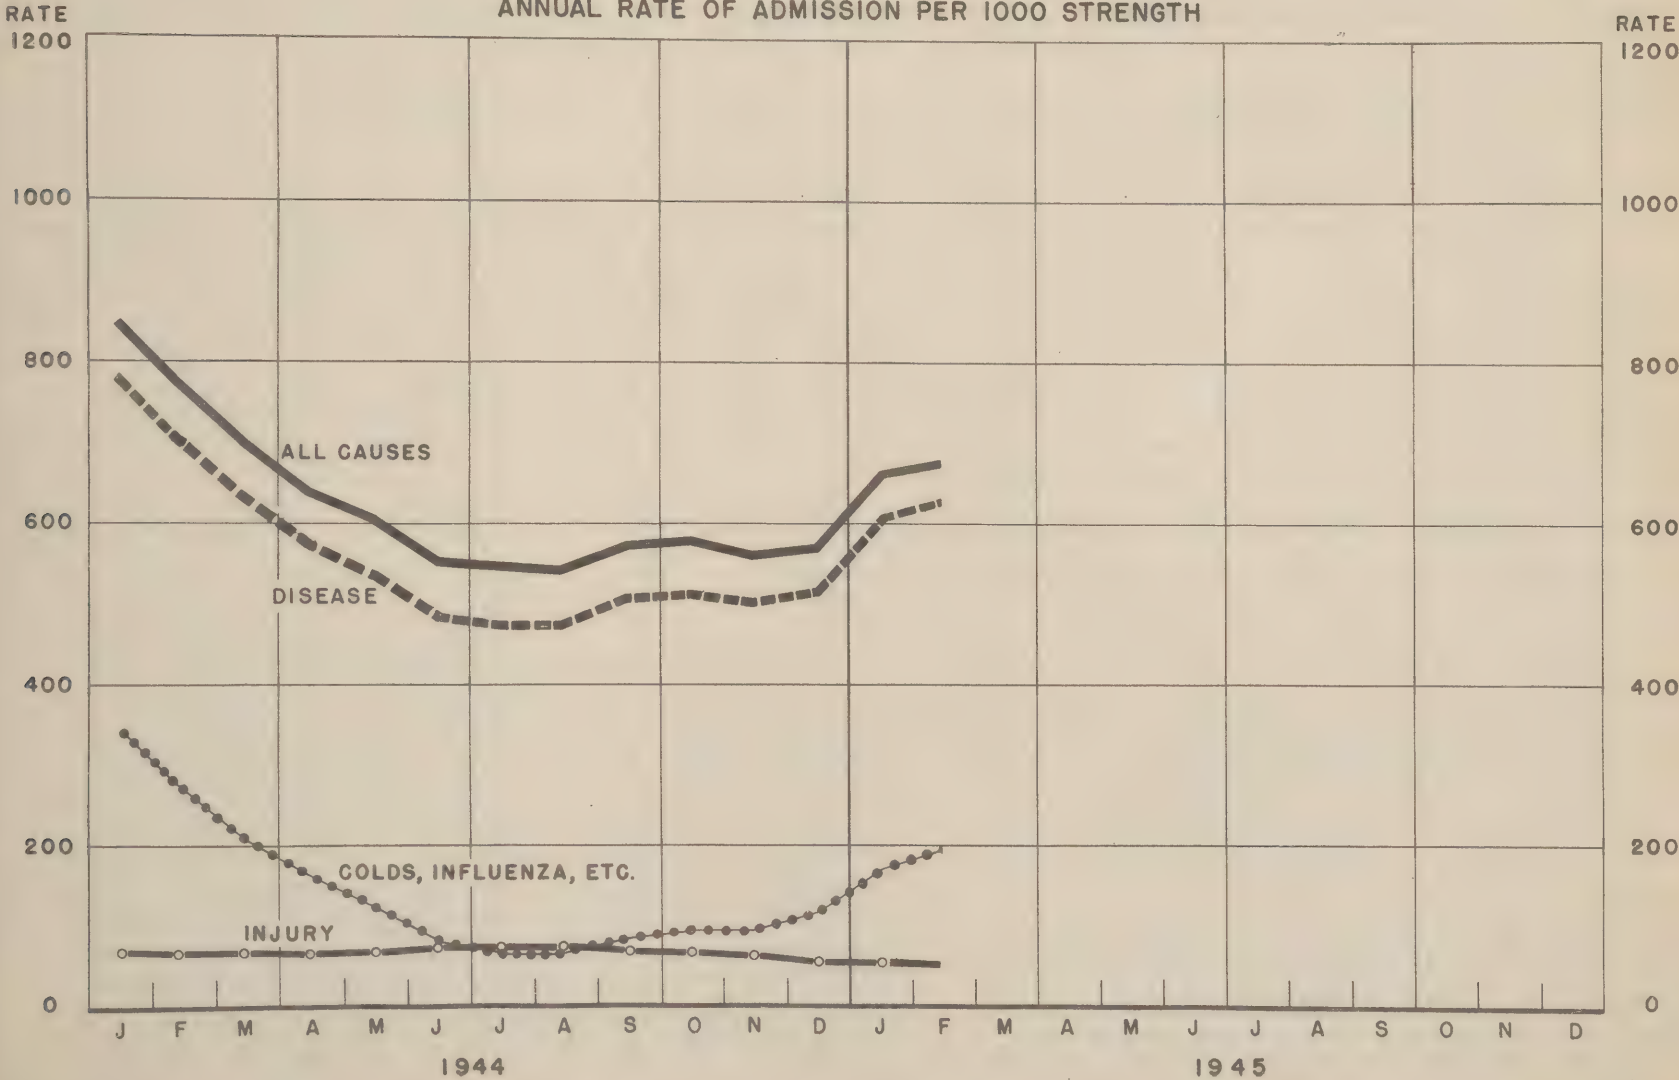

In February atypical pneumonia accounted for about two-thirds of all pneumonia admissions. The proportion of pneumonia cases diagnosed as atypical was highest in the Fourth, Sixth, and Ninth Service Commands, in all of which it exceeded 70 percent.

DIARRHEA AND DYSENTERY:

Morbidity from diarrhea and dysentery remained at substantially the same level in February as in the previous three months. The admission rate for February

MORBIDITY FROM — ALL CAUSES — DISEASE
— INJURY — COLDS, INFLUENZA, ETC.

CONTINENTAL UNITED STATES
ANNUAL RATE OF ADMISSION PER 1000 STRENGTH

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

1945 was about 15 percent lower than for February 1944. Only the Military District of Washington and the Fifth Service Command, with rates of 11 per thousand, registered morbidity from this cause materially in excess of the average for the country as a whole.

VENEREAL DISEASES:

Morbidity from venereal diseases, excluding cases contracted prior to entry into active service, decreased by about 10 percent from the peak rate reported in January. Nevertheless, the February rate of 42.8 per thousand is higher than for any month in 1942, 1943 or 1944. The current experience is about 50 percent higher than for February 1944. The Navy's morbidity from venereal disease during February was at about the same level as during January and thus was slightly lower than the Army's experience in February.

The admission rate for syphilis, excluding EPTS cases, increased slightly to 4.7 per thousand, which is the highest rate reported since November 1943. Thus, most of the decrease in morbidity from all venereal diseases combined was attributable to gonorrhea for which a drop of about 10 percent was registered in February.

Lower morbidity from venereal diseases, excluding EPTS cases, was reported in February by every Service Command except the Second Service Command in which a small increase occurred. Decreases of 20 percent or more were reported by the First, Fifth, Sixth, and Seventh Service Commands and the Military District of Washington.

During February the highest morbidity from venereal diseases, excluding EPTS cases, was reported by the Second and Third Service Commands (about 57 per thousand), with only the Fifth Service Command also reporting a rate in excess of 50 per thousand. The

Second and Third Service Commands had a relatively high experience because of the presence of task force troops not under their jurisdictions. Only the Seventh, Eighth, and Ninth Service Commands and the Military District of Washington reported admission rates from these causes of less than 37 per thousand.

The venereal disease cases remaining under treatment on 23 February are shown below:

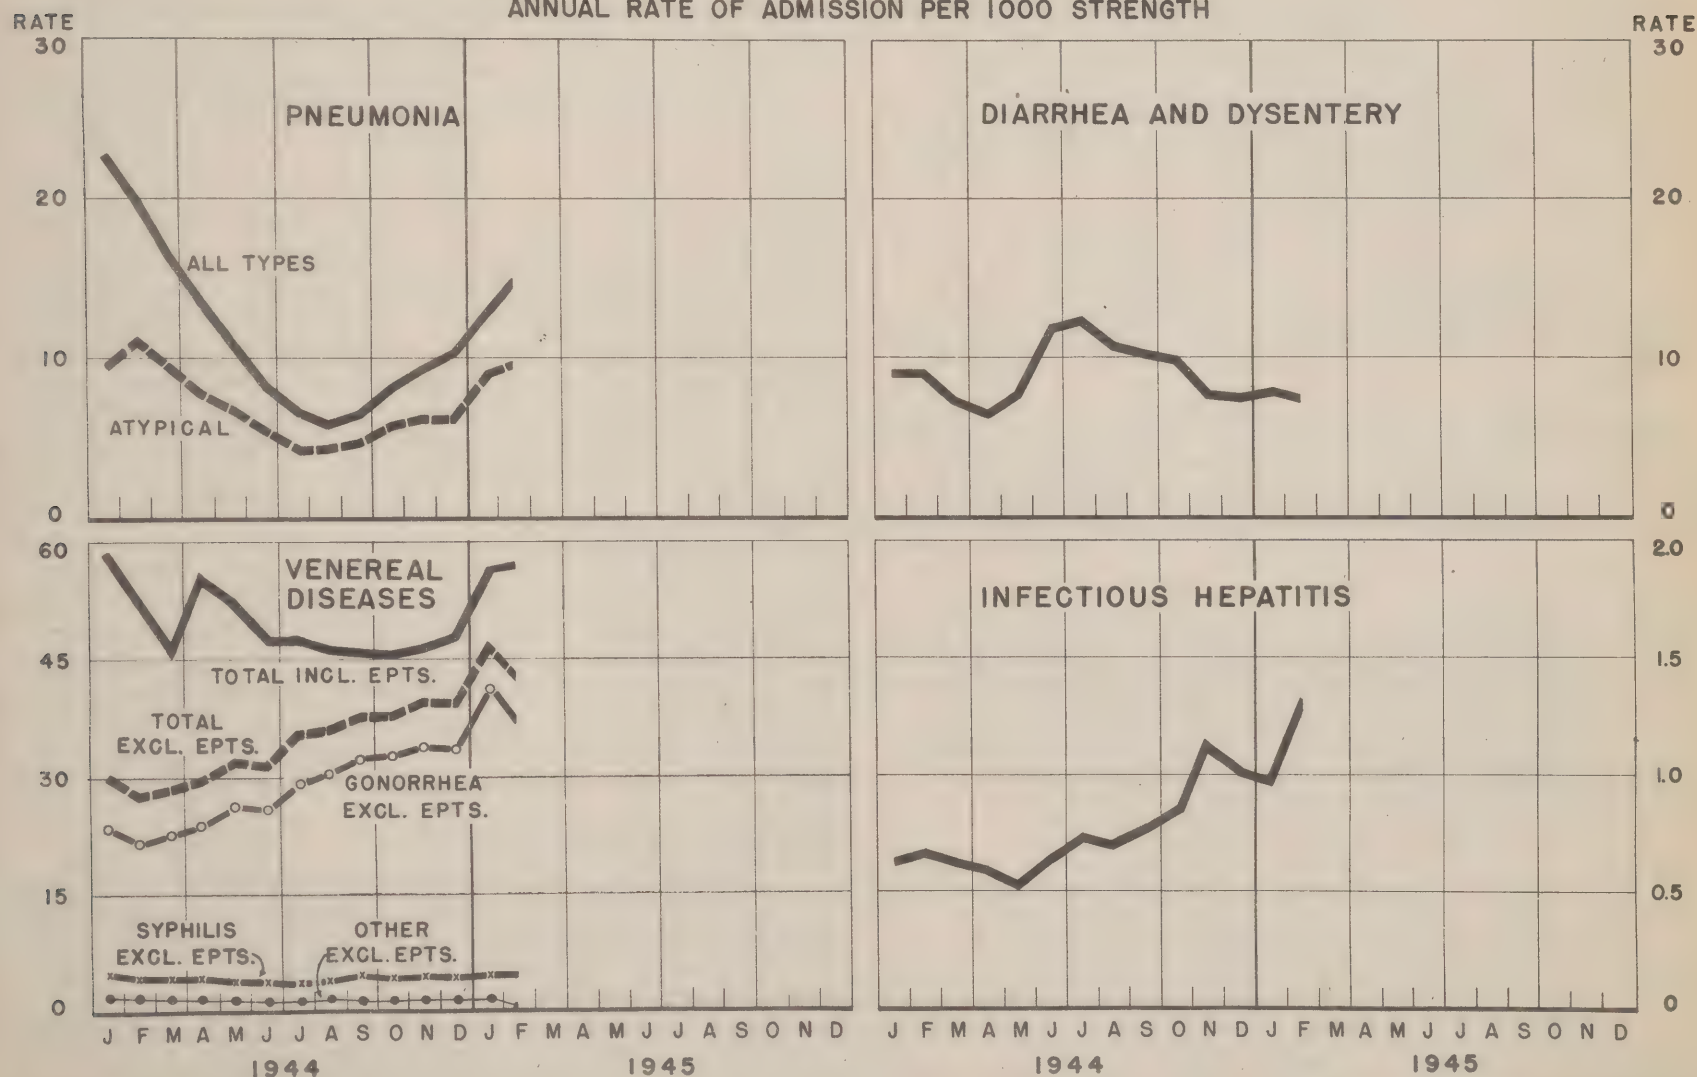

Service Command	Number Remaining Under Treatment		Venereal Disease Cases as Percent of all Cases	
	Syphilis	Other	Syphilis	Other
TOTAL U.S.	1543	825	.68	.37
I	22	36	.2	.4
II	76	95	.4	.5
III	199	84	1.3	.5
MDW	13	16	.4	.5
IV	386	170	.8	.4
V	45	51	.2	.2
VI	30	27	.2	.2
VII	103	37	.5	.2
VIII	449	175	1.2	.5
IX	220	134	.6	.4

The great bulk of the cases remaining were contracted after entry on active service. The number of syphilis cases remaining at the end of February was 7 percent lower than for January, while the number of cases of other venereal diseases decreased about the same amount. Total venereal cases represented 1.05 percent of the total number of patients remaining under treatment in hospital. The very much longer duration of hospitalization for syphilis is indicated by the fact that only 11 percent of the total venereal admissions (excluding EPTS cases) were for this cause, even though 65 percent of the cases remaining under treatment were syphilis cases.

MORBIDITY FROM—PNEUMONIA—DIARRHEA AND DYSENTERY

VENEREAL DISEASES—INFECTIOUS HEPATITIS

CONTINENTAL UNITED STATES
ANNUAL RATE OF ADMISSION PER 1000 STRENGTH

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

Morbidity represented by venereal EPTS cases was reported at 14.2 per thousand during February as compared with 9.7 per thousand for January. Variations in the admission rate for venereal EPTS cases as between Service Commands have relatively little significance, because they reflect a different geographical and racial distribution of Army personnel as compared with that of new inductees. The average weekly number of venereal EPTS cases in February was 788 as compared with 562 in January, reflecting the trend of the number of men inducted into the Army.

The total days lost from duty during February because of venereal disease were about 68,000 or an average of 17,000 per week; this represented a non-effective rate of .83 per thousand as compared with .82 in January.

Detailed data as to the January incidence of venereal diseases by color will be presented in a Special Health Report to be contained in Weekly Health Report No.12.

INFECTIOUS HEPATITIS:

Morbidity from infectious hepatitis increased by about 30 percent in February to 1.3 per thousand, which is the highest rate reported since the epidemic in the summer of 1942. The Second and Sixth Service Commands, with rates of about 2.5 per thousand, reported the highest morbidity from this cause.

MEASLES:

Morbidity from measles doubled in February and was reported at 2.5 per thousand, reflecting the continuation of the anticipated seasonal upward trend. However, the rate for February 1945 is only about one-third as high as that for February 1944. The Fourth and Eighth Service Commands were the only ones to report admission rates from this cause notably in excess of the average for the country as a whole.

MUMPS:

Morbidity from mumps increased by about 25 percent in February to 7.2 per thousand. This rate is about 10 percent in excess of that for February 1944, but is well under the peak rate of 10.5 per thousand registered in March and April 1944. Only the Fourth and Fifth Service Commands (with rates of about 10 per thousand) had morbidity appreciably in excess of the rate for the entire country.

SCARLET FEVER:

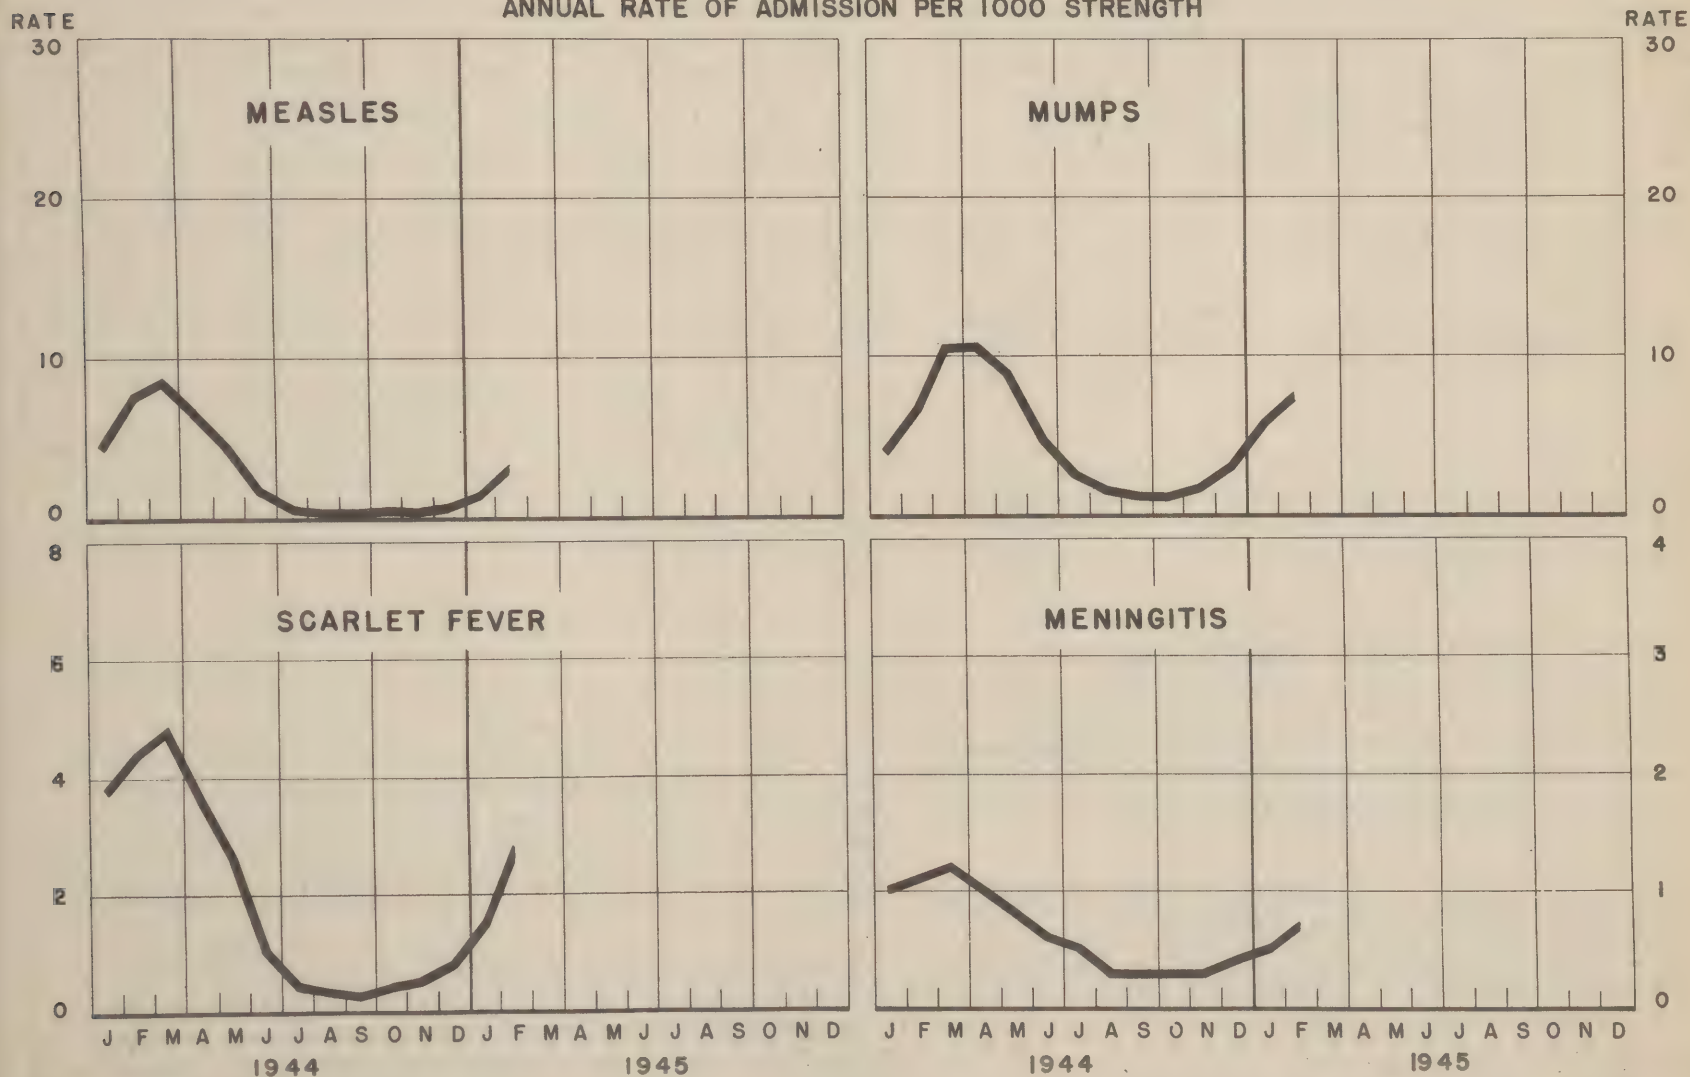

Morbidity from scarlet fever almost doubled in February, being reported at 2.8 per thousand. Nevertheless, this rate was about 35 percent lower than that experienced in the corresponding month of 1944 and only about one-half the peak rate of March 1944. The Sixth Service Command, with a rate of 13 per thousand, was the only one to report morbidity notably in excess of the average for the country as a whole.

MENINGOCOCCIC MENINGITIS:

Morbidity from meningitis was reported at .7 per thousand in February or about double the level during August to December 1944. The rate for February 1945 was 35 percent lower than for February 1944. The Fifth Service Command, with a rate of 1.6 per thousand was the only one to report morbidity appreciably in excess of that for the entire country.

MORBIDITY FROM ——— MEASLES ——— MUMPS SCARLET FEVER ——— MENINGITIS

CONTINENTAL UNITED STATES
ANNUAL RATE OF ADMISSION PER 1000 STRENGTH

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

RHEUMATIC FEVER:

Morbidity from rheumatic fever was reported at .8 per thousand in February, which is the same level that has prevailed since August 1944. The admission rate for February 1945 was thus less than half the rate for February 1944. For the first time in many months the Seventh Service Command did not report the highest morbidity from this cause, being displaced by the Sixth Service Command.

TUBERCULOSIS:

Morbidity from tuberculosis was reported at 1.1 per thousand in February or the same as during the preceding three months. This relatively high present level arises in large part from examinations at separation centers which tend to uncover cases that would otherwise pass by undetected.

As of 23 February there were 1625 cases of tuberculosis remaining under treatment; these represented .72 percent of all patients in hospital. Of the 1625 cases 696 were at Fitzsimons GH and 605 at Bruns GH.

MALARIA:

Morbidity from malaria acquired in the United States was reported at .2 per thousand in February. The number of cases of malaria presumably acquired overseas which were admitted (or readmitted) for treatment in this country averaged about 1400 per week or 5 percent above the weekly average for January, and thus the highest figure so far recorded.

As of 23 February there were 3713 cases of malaria under treatment, representing 1.7 percent of all patients in hospital; only 10 of the 3713 cases were those where the disease was acquired in this country.

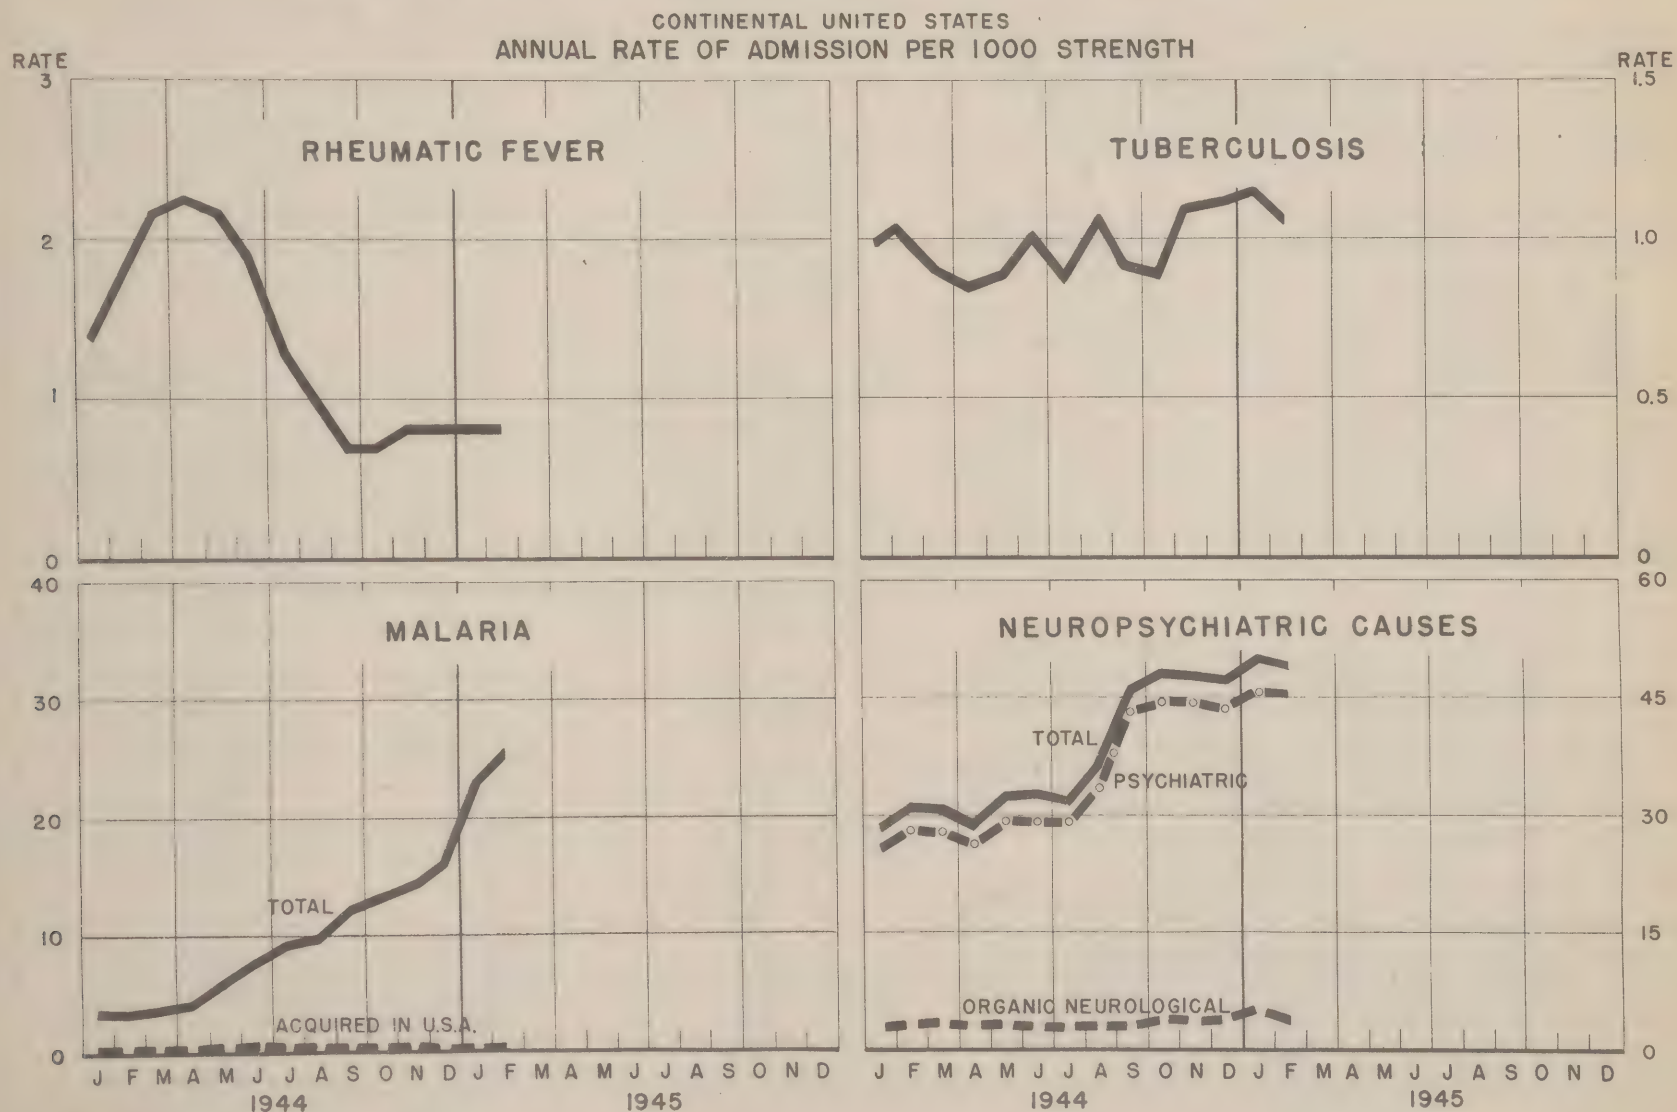

NEUROPSYCHIATRIC DISORDERS:

The annual rate of admission for neuropsychiatric disorders decreased slightly in February to 48.8 per thousand. This rate is at about the same level which prevailed during the previous five months. The decline in the admission rate from these causes during February may reflect the rescission at the end of January of WD Cir. 370, 12 September 1944 which provided that enlisted men not meeting minimum standards for induction and having no suitable assignment could be discharged. This circular led to the examination of large numbers of enlisted men for purposes of discharge, even though many of them were not disabled to a degree which would have warranted a CDD. Thus, even though the admission rate for neuropsychiatric disorders increased markedly following the issuance of WD Cir. 370, 1944, the rate of discharge for neuropsychiatric disorders showed little change, apparently because most mild psychiatric cases were not considered as meeting the requirements for a CDD and were accordingly discharged for the convenience of the Government under Section X, AR 615-360 (now AR 615-365).

Significant decreases in the admission rate for neuropsychiatric disorders in February occurred in the Second, Sixth, and Seventh Service Commands; only in the Third Service Command was a notable increase reported. The Fourth Service Command reported the highest morbidity from this cause (68 per thousand), closely followed by the Second and Third Service Commands. The lowest rates were reported by the Sixth Service Command and the Military District of Washington (25 per thousand).

During February there was an average of 1770 CDD's per week given to enlisted men classified as neuropsychiatric cases. This is about 40 percent higher than the weekly average during January. The CDD's in February in respect to neuropsychiatric disorders

MORBIDITY FROM — RHEUMATIC FEVER — TUBERCULOSIS MALARIA — NEUROPSYCHIATRIC CAUSES

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

accounted for 45 percent of all CDD's or higher than in January (38 percent).

In February organic neurological cases accounted for 7 percent of all neuropsychiatric cases. Only in the Fifth, Sixth, and Seventh Service Commands did the proportion of organic neuropsychiatric cases exceed 10 percent of the total neuropsychiatric cases.

The number of neuropsychiatric cases remaining under treatment as of 23 February was 31,485 or about 3,300 more than at the end of January and thus the highest number reported so far during the war. During February the number of locked ward cases decreased by about 10 percent, whereas the number of open ward cases increased by about 20 percent with most of the rise being reported in the First, Fourth, and Fifth Service Commands. Neuropsychiatric cases remaining represented 14.0 percent of all patients in hospital, with open ward cases being 11.4 percent and locked ward cases 2.6 percent.

MORTALITY:

Mortality from all causes during February was reported at 2.20 per year per thousand strength or 10 percent lower than during the previous three months. The mortality rate from disease increased from .65 per thousand in January to .74 per thousand in February, while the reported mortality rate from injury decreased from 1.83 per thousand to 1.34 per thousand.

It should be noted that the reporting of deaths on Forms 86ab is not complete, particularly for deaths from injury for which the understatement may be as great as 15 percent. The mortality rate from injury when adjusted to allow for this under-reporting is about 1.6 per thousand, resulting in an estimated total death rate from all causes of 2.4 per thousand.

NON-EFFECTIVE RATE:

The non-effective rate for Army personnel stationed in this country was about 35 per thousand in February or the same as in January.

The mean number of non-effectives (including evacuees from overseas) for February was reported at 76.9 per thousand strength or 15 percent higher than in January; most of this increase arose because of an increase in hospital population at General Hospitals. The mean number of injury non-effectives per thousand strength in February was 11.6, per thousand or slightly lower than in January.

Variations in the mean number of non-effectives per thousand strength by Service Command do not reflect so much the variations in morbidity between Service Commands as the varying number of General and Convalescent Hospitals in each Service Command. When comparisons are made between the rates excluding such hospitals, the variations by Service Command are seen to be very much smaller than when the days lost in these hospitals are included, as evidenced in the table below.

Service Command	Including Gen. and Conv. Hosp.	Excluding Gen. and Conv. Hosp.
TOTAL U.S.	76.9	27.4
I	105.4	18.2
II	111.0	24.3
III	81.3	29.3
MDW	71.6	17.9
IV	67.3	31.6
V	178.2	22.6
VI	115.0	22.8
VII	70.2	23.8
VIII	55.1	28.0
IX	72.8	28.3
